# 1 R Skills

## 1.1 Basics

### 1.1.1 Managing Packages

If a package is not yet installed in the current project one may call the function `install.package("PackageName")`. Afterwards the package needs to be included in the current document:

```
library(ggplot2)
```

### 1.1.2 Data Types

```
typeof(5)
typeof("text")
typeof(TRUE)
```

```
## [1] "double"
## [1] "character"
## [1] "logical"
```

### 1.1.3 Arithmetic with R

```
5 + 5 # An addition
5 - 4 # A subtraction
3 * 5 # A multiplication
9 / 3 # A division
2 ^ 5 # Exponentiation
7 %% 3 # Modulo
```

```
## [1] 10
## [1] 1
## [1] 15
## [1] 3
## [1] 32
## [1] 1
```

### 1.1.4 Object Assignment

```
ob1 <- 5
ob2 <- 13
ob1 + ob2
```

```
## [1] 18
```

## 2 Mathematics and Statistics

### 2.1 1. Vectors & Matrices

#### 2.1.1 1.1 Vectors

##### 2.1.1.1 1.1.1 Creating a vector

```
v1 <- c(1, 2, 3, 4, 5)
v1
length(v1)
```

```
## [1] 1 2 3 4 5
## [1] 5
```

##### 2.1.1.2 1.1.2 Getting the components of a vector (slicing)

```
v1[1]
v1[1:3]
```

```
## [1] 1
## [1] 1 2 3
```

##### 2.1.1.3 1.1.3 Auto population of a vector

```
c(rep(0, times = 5))
c(rep(c(1, 2), times = 3))
c(5:9)
c(seq(from = 1, to = 7, by = 2))
c(seq(from = 1, to = 7, length = 5))
```

```
## [1] 0 0 0 0 0
## [1] 1 2 1 2 1 2
## [1] 5 6 7 8 9
## [1] 1 3 5 7
## [1] 1.0 2.5 4.0 5.5 7.0
```

##### 2.1.1.4 1.1.4 Arithmetic with vectors

```
a <- 1:5
b <- 3:7
a+b
a-b
a*b
a/b
a^(b-a)
```

```
## [1] 4 6 8 10 12
## [1] -2 -2 -2 -2 -2
## [1] 3 8 15 24 35
## [1] 0.3333333 0.5000000 0.6000000 0.6666667 0.7142857
## [1] 1 4 9 16 25
```

And the scalar

```
a%*%b
```

```
##      [,1]  
## [1,]   85
```

## 2.1.2 1.2 Matrices

### 2.1.2.1 1.2.1 Creating a matrix

```
m1 <- matrix(c(1:6), ncol = 3, byrow = TRUE)  
m1
```

```
##      [,1] [,2] [,3]  
## [1,]    1    2    3  
## [2,]    4    5    6
```

```
diag(c(1:4))
```

```
##      [,1] [,2] [,3] [,4]  
## [1,]    1    0    0    0  
## [2,]    0    2    0    0  
## [3,]    0    0    3    0  
## [4,]    0    0    0    4
```

```
diag(3)
```

```
##      [,1] [,2] [,3]  
## [1,]    1    0    0  
## [2,]    0    1    0  
## [3,]    0    0    1
```

### 2.1.2.2 1.2.2 Length, Dimensions and Slicing

```
length(m1)  
dim(m1)
```

```
## [1] 6  
## [1] 2 3
```

```
m1[2,3]  
m1[,2]
```

```
## [1] 6  
## [1] 2 5
```

### 2.1.2.3 1.2.3 Arithmetic with matrices

```
m2 <- matrix(c(1:6), ncol = 2, byrow = TRUE)  
m1  
m2
```

```
##      [,1] [,2] [,3]  
## [1,]    1    2    3  
## [2,]    4    5    6  
##      [,1] [,2]  
## [1,]    1    2  
## [2,]    3    4
```

```
## [3,]    5    6
3*m1 # scalar multiplication

##      [,1] [,2] [,3]
## [1,]    3    6    9
## [2,]   12   15   18

m1%%m2

##      [,1] [,2]
## [1,]   22   28
## [2,]   49   64

m2%%m1

##      [,1] [,2] [,3]
## [1,]    9   12   15
## [2,]   19   26   33
## [3,]   29   40   51

m1*m2

## Error in m1 * m2: nicht passende Arrays
```

#### 2.1.2.4 1.2.4 Transpose matrices

Let  $\mathbf{M1} = [a_{ij}]$  then  $\mathbf{M1}' = [a_{ji}]$

```
m1

##      [,1] [,2] [,3]
## [1,]    1    2    3
## [2,]    4    5    6

t(m1)

##      [,1] [,2]
## [1,]    1    4
## [2,]    2    5
## [3,]    3    6

(M1')' = M1

t(t(m1))
```

```
##      [,1] [,2] [,3]
## [1,]    1    2    3
## [2,]    4    5    6

M1M1' always yields a symmetric matrix Q

m1%%t(m1)
```

```
##      [,1] [,2]
## [1,]   14   32
## [2,]   32   77
```

#### 2.1.2.5 1.2.5 Inverse of matrix

An  $n \times n$  matrix  $\mathbf{M}$  has an inverse, denoted  $\mathbf{M}^{-1}$ , provided that  $\mathbf{MM}^{-1} = \mathbf{I}_n$

```
m3 <- matrix(c(2, 5, 1, 3), nrow = 2, byrow = TRUE)
m3
```

```
##      [,1] [,2]
## [1,]    2    5
## [2,]    1    3
```

```
solve(m3)
```

```
##      [,1] [,2]
## [1,]    3   -5
## [2,]   -1    2
```

```
m3%*%solve(m3)
```

```
##      [,1] [,2]
## [1,]    1    0
## [2,]    0    1
```

Otherwise it is said to be noninvertible or singular:

```
solve(matrix(c(1:9), nrow = 3))
```

```
## Error in solve.default(matrix(c(1:9), nrow = 3)): Lapackroutine dgesv: System ist genau singular: U[
```

#### 2.1.2.6 1.2.6 Rank of a matrix

```
m4 <- matrix(c(1,2,3,2,4,6,10,20,30), ncol = 3, byrow = FALSE)
m4
```

```
##      [,1] [,2] [,3]
## [1,]    1    2   10
## [2,]    2    4   20
## [3,]    3    6   30
```

```
qr(m4)$rank
```

```
## [1] 1
```

The rank of the matrix is 1, because  $Col2 = 2 * Col1$  and  $Col3 = 10 * Col1$ . This attribute can be used to reduce the size of matrices and data.

#### 2.1.2.7 1.2.7 Eigenvalues

We use the example of a  $3 \times 3$  matrix. This could be considered as the variance-covariance matrix of three variables, but the main thing is that the matrix is square and symmetric, which guarantees that the eigenvalues  $\lambda_i$  are real numbers.

```
m5 <- matrix(c(13, -4, 2, -4, 11, -2, 2, -2, 8), ncol = 3, byrow = TRUE)
m5
```

```
##      [,1] [,2] [,3]
## [1,]   13   -4    2
## [2,]   -4   11   -2
## [3,]    2   -2    8
```

```
eigen(m5)
```

```
## eigen() decomposition
## $values
```

```
## [1] 17  8  7
##
## $vectors
##      [,1]      [,2]      [,3]
## [1,] 0.7453560 0.6666667 0.0000000
## [2,] -0.5962848 0.6666667 0.4472136
## [3,] 0.2981424 -0.3333333 0.8944272
```

As shown above, this returns a named list, containing the eigenvalues and eigenvectors. One may test the result by calculating the required equation for this eigenvalues:

$$(A - \lambda I_n)x = 0$$

which leads to:

$$\det(A - \lambda I_n) = 0$$

```
m_test1 = m5 - eigen(m5)$values[1] * diag(3)
m_test1
```

```
##      [,1] [,2] [,3]
## [1,]   -4   -4    2
## [2,]   -4   -6   -2
## [3,]    2   -2   -9
```

```
round(det(m_test1), digits = 2)
```

```
## [1] 0
```

Which should also be true for the second eigenvalue:

```
m_test2 = m5 - eigen(m5)$values[2] * diag(3)
round(det(m_test2), digits = 2)
```

```
## [1] 0
```
